THE CLINICALLY PROVEN DRUG-FREE
TREATMENT FOR DEPRESSION

Haṭha Yoga Pradīpikā

2.16. La práctica correcta de *prāṇāyāma* libera de todas las enfermedades, pero una práctica incorrecta puede producirlas.

2.17. Una práctica incorrecta (de *prāṇāyāma*) puede ocasionar molestias en ojos, nariz y oídos, dolores de cabeza, hipo, asma y otras dolencias (pulmonares)

2.18. Para tener éxito (*siddhī*) hay que inspirar y espirar con lentitud, procediendo también de forma gradual con *kumbhaka*.

Efectos.

2.19. Cuando los *nāḍi* están purificados, el cuerpo adelgaza y brilla de forma natural.

2.20. Entonces, el yogui es capaz de retener la respiración a voluntad, se activa el fuego gástrico, el *nada* (sonido interior) se hace audible y la salud es perfecta.

Purificaciones.

2.21. *Shatkarma* debe constituir la primera práctica para las personas flemáticas y de constitución débil. En otro caso (con *vata*, *pitta* y *kapha* equilibrados), no resulta necesario.

2.22. *Shatkarma* se compone de *dhauti*, *vasti*, *neti*, *trataka*, *nauli* y *kapalabhati*.

2.23. Estas seis prácticas purifican el cuerpo y han de mantenerse cuidadosamente en secreto puesto que producen resultados maravillosos y, en consecuencia, son muy apreciadas por los grandes yoguis.

Purificación del tracto digestivo.

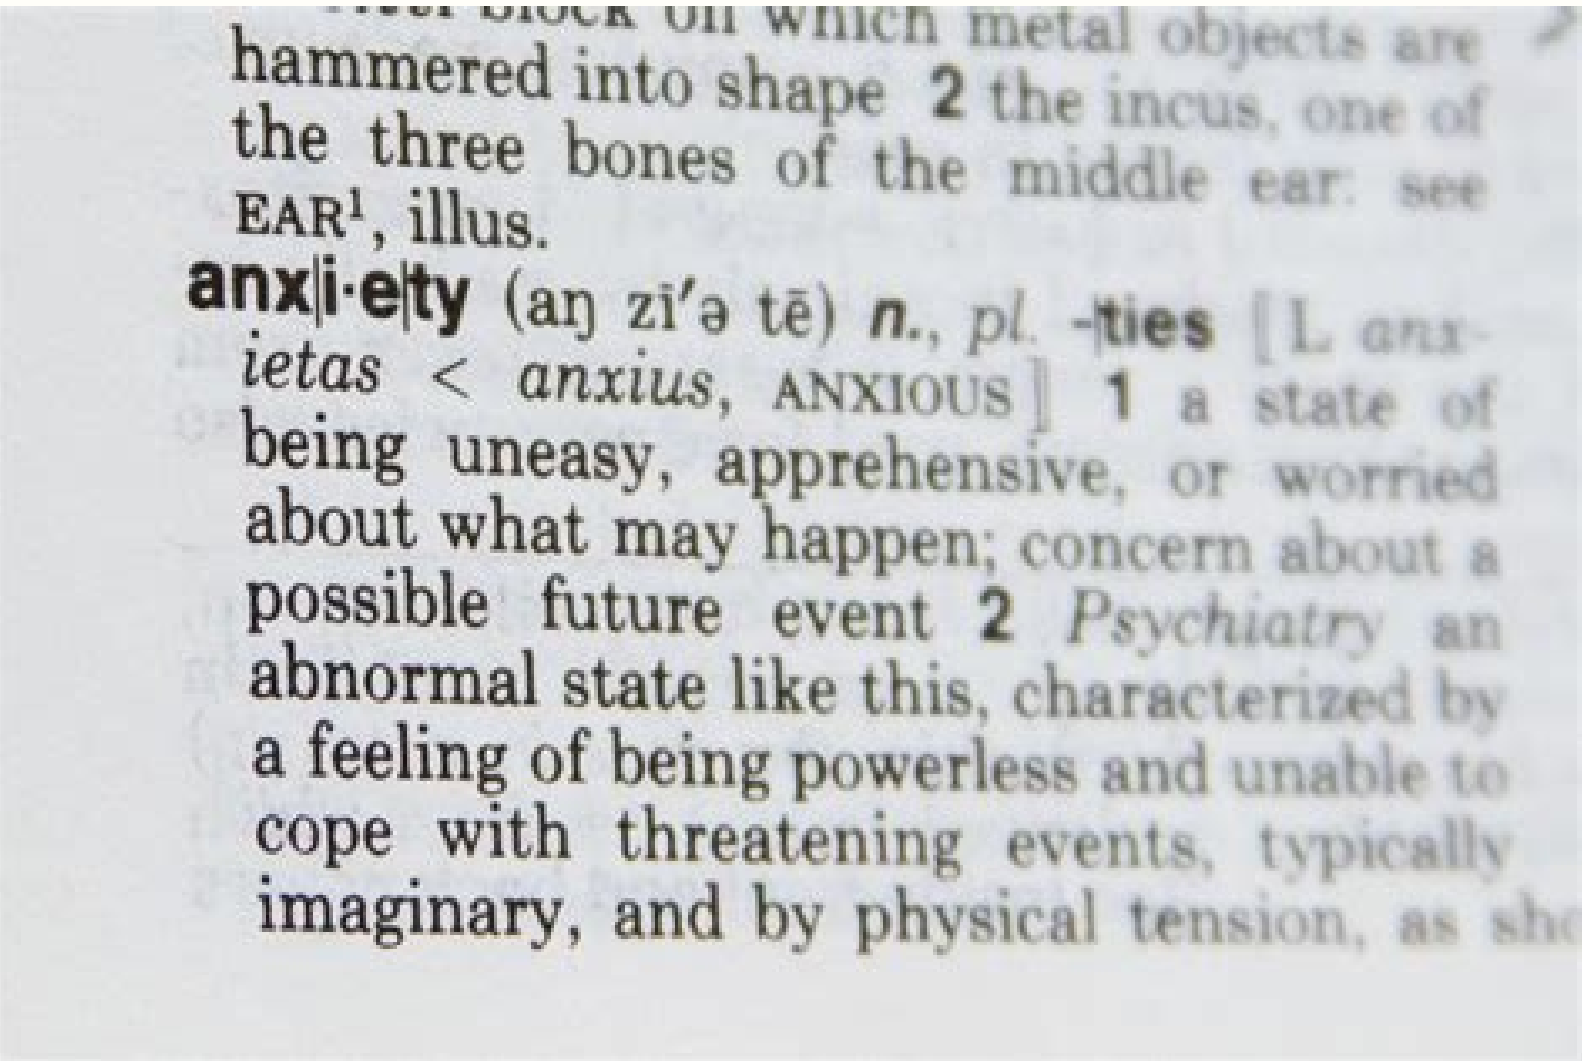

2.24. *Dhauti*: se traga lentamente una tira de tela humedecida, de cuatro pulgadas de ancho y quince palmos de largo, siguiendo las instrucciones del *guru*, y se saca a continuación.

TEN WAYS TO UNTWIST YOUR THINKING	
1	Identify the Distortion
2	Examine the Evidence
3	The Double-Standard Method
4	The Experimental Technique
5	Thinking in Shades of Grey
6	The Survey Method
7	Define Terms
8	The Semantic Method
9	Re-attribution
10	Cost-Benefit Analysis

TEN WAYS TO UNTWIST YOUR THINKING

1.	Identify the Distortion	Write down your negative thoughts so you can see which of the ten cognitive distortions you're involved in. This will make it easier to think about the problem in a more positive and realistic way.
2.	Examine the Evidence	Instead of assuming that your negative thought is true, examine the actual evidence for it. For example, if you feel that you never do anything right, you could list several things you have done successfully.
3.	The Double-Standard Method	Instead of putting yourself down in a harsh, condemning way, talk to yourself in the same compassionate way you would talk to a friend with a similar problem.
4.	The Experimental Technique	Do an experiment to test the validity of your negative thought. For example, if, during the episode of panic, you become terrified that you're about to die of a heart attack, you could jog or run up and down several flights of stairs. This will prove that your heart is healthy and strong.
5.	Thinking in Shades of Grey	Although this method might sound drab, the effects can be illuminating. Instead of thinking about your problems in all-or-nothing extremes, evaluate things on a range of 0 to 100. When things don't work out as well as you hoped, think about the experience as a partial success rather than a complete failure. See what you can learn from the situation.
6.	The Survey Method	Ask people questions to find out if your thoughts and attitudes are realistic. For example, if you believe that public speaking anxiety is abnormal and shameful, ask several friends if they ever felt nervous before they gave a talk.
7.	Define Terms	When you label yourself "inferior" or "a fool" or "a loser," ask, "What is the definition of a 'fool'?" You will feel better when you see that there is no such thing as a "fool" or a "loser."
8.	The Semantic Method	Simply substitute language that is less colorful and emotionally loaded. This method is helpful for "should statements." Instead of telling yourself "I shouldn't have made that mistake," you can say, "It would be better if I hadn't made that mistake."
9.	Re-attribution	Instead of automatically assuming that you are "bad" and blaming yourself entirely for a problem, think about the many factors that may have contributed to it. Focus on solving the problem instead of using up all your energy blaming yourself and feeling guilty.
10.	Cost-Benefit Analysis	List the advantages and disadvantages of a feeling (like getting angry when your plane is late), a negative thought (like "No matter how hard I try, I always screw up"), or a behavior pattern (like overeating and lying around in bed when you're depressed). You can also use the Cost-Benefit Analysis to modify a self-defeating belief such as, "I must always try to be perfect."

Feeling good handbook worksheets pdf.

Mind Over Mood: Change How You Feel by Changing the Way You ThinkAuthors: Dennis Greenberger, PhD; Christine Padesky, PhD; & Aaron Beck, MD Make life an exhilarating experience!With his phenomenally successfulFeeling Good: The New Mood Therapy, Dr. David Burns introduced a groundbreaking, drug-free treatment for depression. Now in this long-awaited sequel, he reveals powerful new techniques and provides step-by-step exercises that help you cope with the full range of everyday problems. * Free from fears, phobias, and panic attacks* Overcome self-defeating attitudes* Discover the five secrets of intimate communication* Put an end to marital conflict* Conquer procrastination and unleash your potential for successWith an up-to-date section on everything you need to know about commonly prescribed psychiatric drugs and anxiety disorders such as agoraphobia and obsessive-compulsive disorder, this remarkable guide can show you how to feel good about yourself and the people you care about. You will discover that life can be an exhilarating experience. We tend to trust what goes on in our brains. After all, if you can't trust your own brain, what can you trust? Generally, this is a good thing—our brain has been wired to alert us to danger, attract us to potential mates, and find solutions to the problems we encounter every day. However, there are some occasions when you may want to second guess what your brain is telling you. It's not that your brain is purposely lying to you, it's just that it may have developed some faulty or non-helpful connections over time. It can be surprisingly easy to create faulty connections in the brain. Our brains are predisposed to making connections between thoughts, ideas, actions, and consequences, whether they are truly connected or not. This tendency to make connections where there is no true relationship is the basis of a common problem when it comes to interpreting research: the assumption that because two variables are correlated, one causes or leads to the other. The refrain "correlation does not equal causation!" is a familiar one to any student of psychology or the social sciences. It is all too easy to view a coincidence or a complicated relationship and make false or overly simplistic assumptions in research—just as it is easy to connect two events or thoughts that occur around the same time when there are no real ties between them. There are many terms for this kind of mistake in social science research, complete with academic jargon and overly complicated phrasing. In the context of our thoughts and beliefs, these mistakes are referred to as "cognitive distortions." Before you continue, we thought you might like to download our three Positive CBT Exercises for free. These science-based exercises will provide you with a detailed insight into Positive CBT and will give you additional tools to address cognitive distortions in your therapy or coaching. What are Cognitive Distortions? Cognitive distortions are biased perspectives we take on ourselves and the world around us. They are irrational thoughts and beliefs that we unknowingly reinforce over time. These patterns and systems of thought are often subtle—it's difficult to recognize them when they are a regular feature of your day-to-day thoughts. That is why they can be so damaging since it's hard to change what you don't recognize as something that needs to change! Cognitive distortions come in many forms (which we'll cover later in this piece), but they all have some things in common. All cognitive distortions are: Tendencies or patterns of thinking or believing; That are false or inaccurate; And have the potential to cause psychological damage. It can be scary to admit that you may fall prey to distorted thinking. You might be thinking, "There's no way I am holding on to any blatantly false beliefs!" While most people don't suffer in their daily lives from these kinds of cognitive distortions, it seems that no one can completely escape these distortions. If you're human, you have likely fallen for a few of the numerous cognitive distortions at one time or another. The difference between those who occasionally stumble into a cognitive distortion and those who struggle with them on a more long-term basis is the ability to identify and modify or correct these faulty patterns of thinking. As with many skills and abilities in life, some are far better at this than others—but with practice, you can improve your ability to recognize and respond to these distortions. These distortions have been shown to relate positively to symptoms of depression, meaning that where cognitive distortions abound, symptoms of depression are likely to occur as well (Burns, Shaw, & Croker, 1987). In the words of the renowned psychiatrist and researcher David Burns: "I suspect you will find that a great many of your negative feelings are in fact based on such thinking errors." Errors in thinking, or cognitive distortions, are particularly effective at provoking or exacerbating symptoms of depression. It is still a bit ambiguous as to whether these distortions cause depression or depression brings out these distortions (after all, correlation does not equal causation!) but it is clear that they frequently go hand-in-hand. Much of the knowledge around cognitive distortions comes from research by two experts: Aaron Beck and David Burns. Both are prominent in the fields of psychiatry and psychotherapy. Experts in Cognitive Distortions: Aaron Beck and David Burns. Both are prominent in the fields of psychiatry and psychotherapy. As such, there are numerous cognitive distortions floating around in the literature, but we'll limit this list to the most common sixteen. The big name in depression and treatment research, Dr. David Burns, also spent some time learning and developing his skills at the University of Pennsylvania—it seems that UPenn is particularly good at producing future leaders in psychology! Burns graduated from Stanford University School of Medicine and moved on to the University of Pennsylvania School of Medicine, where he completed his psychiatry residency and cemented his interest in the treatment of mental health disorders (Feeling Good, n.d.). He is currently serving as a Professor Emeritus of Psychiatry and Behavioral Sciences at the Stanford University School of Medicine, in addition to continuing his research on treating depression and training therapists to conduct effective psychotherapy sessions (Feeling Good, n.d.). Much of his work is based on Beck's research revealing the potential impacts of distorted thinking and suggesting ways to correct this thinking. He is perhaps most well known outside of strictly academic circles for his worldwide best-selling book Feeling Good: The New Mood Therapy. This book has sold more than 4 million copies within the United States alone and is often recommended by therapists to their patients struggling with depression (Summit for Clinical Excellence, n.d.). This book outlines Burns' approach to treating depression, which mostly focuses on identifying, correcting, and replacing distorted systems and patterns of thinking. If you are interested in learning more about this book, you can find it on Amazon with over 1,400 reviews to help you evaluate its effectiveness. (To hear more about Burns' work in the treatment of depression, check out his TED talk on the subject below. As Burns discusses in the above video, his studies of depression have also influenced the studies around joy and self-esteem. The most researched form of psychotherapy right now is covered by his book, Feeling Good, aimed at providing tools to the general public. A List of the Most Common Cognitive Distortions Beck and Burns are not the only two researchers who have dedicated their careers to studying and correcting cognitive distortions. There are many others who have also dedicated their careers to this work. The list below is not exhaustive, but it is a good starting point. 1. All-or-Nothing Thinking / Polarized Thinking Also known as "Black-and-White Thinking," this distortion manifests as an inability or unwillingness to see shades of gray. In other words, you see things in terms of extremes – something is either fantastic or awful, you believe you are either perfect or a total failure. 2. Overgeneralization This sneaky distortion takes one instance or example and generalizes it to an overall pattern. For example, a student may receive a C on one test and conclude that she is stupid and a failure. Overgeneralizing can lead to overly negative thoughts about yourself and your environment based on only one or two experiences. 3. Mental Filter Similar to overgeneralization, the mental filter distortion focuses on a single negative piece of information and excludes all the positive ones. An example of this distortion is one partner in a romantic relationship dwelling on a single negative comment made by the other partner and viewing the relationship as hopelessly lost, while ignoring the years of positive comments and experiences. The mental filter can foster a decidedly pessimistic view of everything around you by focusing only on the negative. 4. Disqualifying the Positive On the flip side, the "Disqualifying the Positive" distortion acknowledges positive experiences but rejects them instead of embracing them. For example, a person who receives a positive review at work might reject the idea that they are a competent employee and attribute the positive review to political correctness, or to their boss simply not wanting to talk about their employee's performance problems. This is an especially malignant distortion since it can facilitate the continuation of negative thought patterns even in the face of strong evidence to the contrary. 5. Jumping to Conclusions - Mind Reading This "Jumping to Conclusions" distortion manifests as the inaccurate belief that we know what another person is thinking. Of course, it is possible to have
an idea of what other people are thinking, but this distortion refers to the negative interpretations that we put on their thoughts. 6. Jumping to Conclusions - Fortune Telling A sister distortion to mind reading, fortune telling refers to the tendency to make conclusions and predictions based on little to no evidence and holding them as gospel truth. One example of fortune-telling is a young, single woman predicting that she will never find love or have a committed and happy relationship based only on the fact that she has not found it yet. There is simply no way for her to know how her life will turn out, but she sees this prediction as fact rather than one of several possible outcomes. 7. Magnification (Catastrophizing) or Minimization Also known as the "Binocular Trick" for its stealthy skewing of your perspective, this distortion involves exaggerating or minimizing the meaning, importance, or likelihood of things. An athlete who is generally a good player but makes a mistake may magnify the importance of that mistake and believe that he is a terrible teammate, while an athlete who wins a coveted award in her sport may minimize the importance of the award and continue believing that she is only a mediocre player. 8. Emotional Reasoning This may be one of the most surprising distortions to many readers, and it is also one of the most important to identify and address. The logic behind this distortion is not surprising to most people; rather, it is the realization that virtually all of us have bought into this distortion at one time or another. Emotional reasoning refers to the acceptance of one's emotions as fact. It can be described as "I feel it, therefore it must be true." Just because we feel something doesn't mean it is true; for example, we may become jealous and think our partner has feelings for someone else, but that doesn't make it true. Of course, we know it isn't reasonable to take our feelings as fact, but it is a common distortion nonetheless. Relevant: What is Emotional Intelligence? - 18 Ways to Improve It 9. Should Statements Another particularly damaging distortion is the tendency to make "should" statements. Should statements are statements that you make to yourself about what you "should" do, what you "ought" to do, or what you "must" do. They can also be applied to others, imposing a set of expectations that will likely not be met. When we hang on too tightly to our "should" statements about ourselves, the result is often guilt that we cannot live up to them. When we cling to our "should" statements about others, we are generally disappointed by their failure to meet our expectations, leading to anger and resentment. 10. Labeling and Mislabeling These tendencies are basically extreme forms of overgeneralization, in which we assign judgments of value to ourselves or to others based on one instance or experience. For example, a student who labels herself as "an utter fool" for failing an assignment is engaging in this distortion, as is the waiter who labels a customer "a grumpy old miser" if he fails to thank the waiter for bringing his food. Mislabeling refers to the application of highly emotional, loaded, and inaccurate or unreasonable language when labeling. 11. Personalization As the name implies, this distortion involves taking everything personally or assigning blame to yourself without any logical reason to believe you are to blame. This distortion covers a wide range of situations, from assuming you are the reason a friend did not enjoy the girls' night out, to the more severe examples of believing that you are the cause for every instance of moodiness or irritation in those around you. In addition to these basic cognitive distortions, Beck and Burns have mentioned a few others (Beck, 1976; Burns, 1980): 12. Control Fallacies A control fallacy manifests as one of two beliefs: (1) that we have no control over our lives and are helpless victims of fate, or (2) that we are in complete control of ourselves and our surroundings, giving us responsibility for the feelings of those around us. Both beliefs are damaging, and both are equally inaccurate. No one is in complete control of what happens to them, and no one has absolutely no control over their situation. Even in extreme situations where an individual seemingly has no choice in what they do or where they go, they still have a certain amount of control over how they approach their situation mentally. 13. Fallacy of Fairness While we would all probably like to operate in a world that is fair, the assumption of an inherently fair world is not based in reality and can foster negative feelings when we are faced with proof of life's unfairness. A person who judges every experience by its perceived fairness has fallen for this fallacy, and will likely feel anger, resentment, and hopelessness when they inevitably encounter a situation that is not fair. 14. Fallacy of Change Another 'fallacy' distortion involves expecting others to change if we pressure or encourage them enough. This distortion is usually accompanied by a belief that our happiness and success rests on other people, leading us to believe that forcing those around us to change is the only way to get what we want. A man who thinks "If I just encourage my wife to stop doing the things that irritate me, I can be a better husband and a happier person" is exhibiting the fallacy of change. 15. Always Being Right Perfectionists and those struggling with Imposter Syndrome will recognize this distortion – it is the belief that we must always be right. For those struggling with this distortion, the idea that we could be wrong is absolutely unacceptable, and we will fight to the metaphorical death to prove that we are right. For example, the internet commenters who spend hours arguing with each other over an opinion or political issue far beyond the point where reasonable individuals would conclude that they should "agree to disagree" are engaging in the "Always Being Right" distortion. To them, it is not simply a matter of a difference of opinion, it is an intellectual battle that must be won at all costs. 16. Heaven's Reward Fallacy This distortion is a popular one, and it's easy to see myriad examples of this fallacy playing out on big and small screens across the world. The "Heaven's Reward Fallacy" manifests as a belief that one's struggles, one's suffering, and one's hard work will result in a just reward. It is obvious why this type of thinking is a distortion – how many examples can you think of, just within the realm of your personal acquaintances, where hard work and sacrifice did not pay off? Sometimes no matter how hard we work or how much we sacrifice, we will not achieve what we hope to achieve. To think otherwise is a potentially damaging pattern of thought that can result in disappointment, frustration, anger, and even depression when the awaited reward does not materialize. Changing Your Thinking: Examples of Techniques to Combat Cognitive Distortions These distortions, while common and potentially extremely damaging, are not something we must simply resign ourselves to living with. Beck, Burns, and other researchers in this area have developed numerous ways to identify, challenge, minimize, or erase these distortions from our thinking. Some of the most effective and evidence-based techniques are listed below. Cognitive Distortions Handout Since you must first identify the distortions you struggle with before you can effectively challenge them, this resource is a must-have. The Cognitive Distortions handout lists and describes several types of cognitive distortions to help you figure out which ones you might be dealing with. The distortions listed include: All-or-Nothing Thinking; Overgeneralizing; Discounting the Positive; Jumping to Conclusions; Mind Reading; Fortune Telling; Magnification (Catastrophizing) and Minimizing; Emotional Reasoning; Should Statements; Labeling and Mislabeling; Personalization. The descriptions are accompanied by helpful descriptions and a couple of examples. This information can be found in the Increasing Awareness of Cognitive Distortions exercise in the Positive Psychology Toolkit®. Automatic Thought Record This worksheet is an excellent tool for identifying and understanding your cognitive distortions. Our automatic, negative thoughts are often related to a distortion that we may or may not realize we have. Completing this exercise can help you to figure out where you are making inaccurate assumptions or jumping to false conclusions. The worksheet is split into six columns: Date/Time Situation Automatic Thoughts (ATs) Emotion/s Your Response A More Adaptive Response First, you note the date and time of the thought. In the second column, you will write down the situation. Ask yourself: What led to this event? What caused the unpleasant feelings I am experiencing? The third component of the worksheet directs you to write down the negative automatic thought, including any images or feelings that accompanied the thought. You will consider the thoughts and images that went through your mind, write them down, and determine how much you believed these thoughts. After you have identified the thought, the worksheet instructs you to rate the emotions that ran through your mind along with the thought, and then to rate how much you believed the thought. The fourth component of the worksheet asks you to write down the evidence that supports the thought, and then to write down the evidence that challenges the thought. Ask yourself these questions: Which cognitive distortions were you employing? What is the evidence that the automatic thought(s) is true, and what evidence is there that it is not true? You've thought about the worst that can happen, but what's the best that could happen? What's the most realistic scenario? How likely are the best-case and most realistic scenarios? Finally, you will consider the outcome of this event. Think about how
much you believe the automatic thought now that you've come up with an adaptive response, and rate your belief. Determine what emotion(s) you are feeling now and at what intensity you are experiencing them. You can access the Automatic Thought Record Worksheet here. Decatastrophizing This is a particularly good tool for talking yourself out of catastrophizing a situation. The worksheet begins with a description of cognitive distortions in general and catastrophizing in particular; catastrophizing is when you distort the importance or meaning of a problem to be much worse than it is, or you assume that the worst possible scenario is going to come to pass. It's a reinforcing distortion, as you get more and more anxious the more you think about it, but there are ways to combat it. First, write down your worry. Identify the issue you are catastrophizing by answering the question, "What are you worried about?" Once you have articulated the issue that is worrying you, you can move on to thinking about how this issue will turn out. Think about how terrible it would be if the catastrophe actually came to pass. What is the worst-case scenario? Consider whether a similar event has occurred in your past and, if so, how often it occurred. With the frequency of this catastrophe in mind, make an educated guess of how likely the worst-case scenario is to happen. After, think about what is most likely to happen—not the best possible outcome, not the worst possible outcome, but the most likely. Consider this scenario in detail and write it down. Note how likely you think this scenario is to happen as well. Next, write down the evidence that supports the thought, and then write down the evidence that challenges the thought. Ask yourself these questions: Which cognitive distortions were you employing? What is the evidence that the automatic thought(s) is true, and what evidence is there that it is not true? You've thought about the worst that can happen, but what's the best that could happen? What's the most realistic scenario? How likely are the best-case and most realistic scenarios? Finally, you will consider the outcome of this event. Think about how much you believe the automatic thought now that you've come up with an adaptive response, and rate your belief. Determine what emotion(s) you are feeling now and at what intensity you are experiencing them. You can access the Automatic Thought Record Worksheet here. Decatastrophizing This is a particularly good tool for talking yourself out of catastrophizing a situation. Ask yourself these questions: Which cognitive distortions were you employing? What is the evidence that the automatic thought(s) is true, and what evidence is there that it is not true? You've thought about the worst that can happen, but what's the best that could happen? What's the most realistic scenario? How likely are the best-case and most realistic scenarios? Finally, you will consider the outcome of this event. Think about how much you believe the automatic thought now that you've come up with an adaptive response, and rate your belief. Determine what emotion(s) you are feeling now and at what intensity you are experiencing them. You can access the Automatic Thought Record Worksheet here. Decatastrophizing This is a particularly good tool for talking yourself out of catastrophizing a situation. The worksheet begins with a description of cognitive distortions in general and catastrophizing in particular; catastrophizing is when you distort the importance or meaning of a problem to be much worse than it is, or you assume that the worst possible scenario is going to come to pass. It's a reinforcing distortion, as you get more and more anxious the more you think about it, but there are ways to combat it. First, write down your worry. Identify the issue you are catastrophizing by answering the question, "What are you worried about?" Once you have articulated the issue that is worrying you, you can move on to thinking about how this issue will turn out. Think about how terrible it would be if the catastrophe actually came to pass. What is the worst-case scenario? Consider whether a similar event has occurred in your past and, if so, how often it occurred. With the frequency of this catastrophe in mind, make an educated guess of how likely the worst-case scenario is to happen. After, think about what is most likely to happen—not the best possible outcome, not the worst possible outcome, but the most likely. Consider this scenario in detail and write it down. Note how likely you think this scenario is to happen as well. Next, write down the evidence that supports the thought, and then write down the evidence that challenges the thought. Ask yourself these questions: Which cognitive distortions were you employing? What is the evidence that the automatic thought(s) is true, and what evidence is there that it is not true? You've thought about the worst that can happen, but what's the best that could happen? What's the most realistic scenario? How likely are the best-case and most realistic scenarios? mental health issue, it doesn't hurt to evaluate your own thoughts every now and then. The sooner you catch a cognitive distortion and mount a defense against it, the less likely it is to make a negative impact on your life. What is your experience with cognitive distortions? Which ones do you struggle with? Do you think we missed any important ones? How have you tackled them, whether in CBT or on your own? Let us know in the comments below. We love hearing from you. We hope you enjoyed reading this article. For more information, don't forget to download our 3 Positive CBT Exercises for free. Beck, A. T. (1976). Cognitive therapies and emotional disorders.
